

PRODEO CAPITAL

FiSH, ProdeoPay, Talent, and Optimyse: A Commercial Product and Business Roadmap

Prepared by: Adefemi Olawale Falase, The Prodeo Group

Status: Internal Commercial Strategy Draft | Private & Confidential | July 2026

This is a private commercial roadmap for Prodeo Capital's own products. It is not a policy proposal, and no part of it should be read as requiring, or evidencing, action by any government, central bank, or regional institution. Where it references the Strategy and Policy Document on West African monetary sovereignty (PAPSS/ARU), it does so only to note a possible future integration opportunity — Prodeo Capital's commercial success does not depend on that policy being adopted.

1. Purpose and Scope

This document sets out Prodeo Capital's product architecture and commercial roadmap: a cloud-native accounting engine (FiSH), a retail payment application (ProdeoPay), a gold-backed wallet currency (Talent), a digital credit union (Purse), and an active treasury management system (Optimyse, currently named Scrip). It is deliberately kept separate from the Strategy and Policy Document on West African monetary sovereignty, which addresses PAPSS, the African Reserve Unit, and related institutional policy. That document is written for regulators and continental institutions; this one is written as an ordinary private-sector business roadmap.

The separation exists to protect both documents' credibility: institutional policy analysis should not read as a pitch for a private company's products, and a commercial roadmap should not overstate its dependence on institutional policy outcomes it does not control.

2. Corporate Structure

The Prodeo Group owns Prodeo Capital, its financial-services division. Prodeo Capital owns two departments with distinct but symbiotic objectives:

Department	Function
FiSH GL Engine	Cloud-native, multi-tenant general ledger and accounting infrastructure
Treasury Management (Optimyse / Scrip)	Active, algorithmically managed investment engine

FiSH's tenant-wide ledger visibility identifies, accurately and continuously, which balances across its business-owner tenants are genuinely at rest. Treasury Management is the department that can then offer to put identified balances to work — a natural upsell path from ledger tenancy into active fund management, without FiSH itself holding any position or bearing any investment risk.

3. The Three-Function Paradigm: Rest, Transit, Work

Prodeo Capital's product suite is organised around three functions of money, each represented by a distinct, named, client-facing product, with FiSH as the shared ledger underneath all three:

Function	Product	Role
Money at Rest	Talent	A gold-backed wallet currency inside ProdeoPay — no counterparty, no issuer promise, redeemable into the gold backing it
Money in Transit	ProdeoPay	A retail payment application — transfers, bill pay, merchant payments — built to compete directly with Opay and PalmPay
Money at Work	Optimyse (Scrip)	An algorithmically managed treasury system actively deploying client AUM, bearing genuine investment risk directly

FiSH is not a fourth product alongside these three; it is the ledger substrate beneath all three simultaneously, giving Prodeo Capital a single, continuously reconciled view of a member's complete position across rest, transit, and work at once.

4. Product Descriptions

4.1 FiSH — The Ledger Engine

FiSH (Financial Information Systems Handler) is a cloud-native, multi-tenant general ledger engine, with subsystems spanning HR, SOP, IM, and POP. Its tenants are business owners generally, not only Purse's members or ProdeoPay's users — any business can use FiSH to process its business information, with a gamified user experience a deliberate design objective.

Its obligation is accuracy of record: a balance FiSH reports must at all times match structural reality, with no gap between the ledger and the underlying position.

4.2 Purse — The Digital Credit Union

Purse is the digital credit union itself. Its foundational case rests on three grounds: financial inclusion, reaching populations excluded from collateral-based traditional banking; anti-usury lending, in which no interest is charged; and social-collateral credit underwriting, using group accountability and contribution history in place of collateral.

4.2.1 The Digital Osusu Project

Purse's foundational mechanism is a digitisation of Osusu — the rotating savings and credit association tradition found across West Africa under various names (Osusu in Sierra Leone, Esusu and Ajo in Nigeria, Susu in Ghana), in which a group of members contribute regularly to a shared pool and take turns receiving the full payout, with trust and social standing substituting for collateral. The Digital Osusu Project is the initiative that carries this tradition onto Purse's platform, rather than treating financial inclusion as a feature to be designed from first principles.

Social Collateral — group accountability and contribution history stand in for the real estate or salary history traditional banks require, which excludes roughly 75% of the target population from conventional lending. A member's standing within their Osusu group becomes their creditworthiness record.

Hardware Integration — fintech is embedded at the firmware level of distributed smartphones, so that the device itself functions as collateral. A default results in feature restrictions on the handset, providing a direct, low-friction repayment incentive without requiring formal collateral seizure or legal recourse.

Regulatory Roadmap — a three-step path starting in Sierra Leone: testing social-scoring algorithms within the Bank of Sierra Leone's regulatory sandbox; formal registration as a cooperative society under the Ministry of Trade and Industry; and, once established, integration with PAPSS to allow these grassroots savings pools to participate in regional trade settlement.

The Digital Osusu Project is the specific, named initiative through which Purse's inclusion mission (Section 4.2) is being executed in practice, beginning with a Sierra Leone pilot before any wider regional rollout.

4.3 ProdeoPay — The Payment Application

ProdeoPay is a retail-facing payment system built to replicate Opay and PalmPay: wallet, bill pay, peer-to-peer transfer, and merchant payments. Its differentiator against both incumbents is Talent — neither Opay nor PalmPay offers a wallet balance with property-money discipline behind it; their savings products are national-currency-denominated and carry the same inflation and currency risk as holding cash.

4.4 Talent — The Gold-Backed Wallet Currency

Talent is a gold-backed unit of value held inside a ProdeoPay wallet, alongside national-currency balances. It carries a deliberate property-money discipline: no counterparty, no issuer promise, and redemption terms honestly matched to the gold actually backing it. The name is drawn from the ancient unit of weight used to measure and price gold and silver directly, and carries the Parable of the Talents' stewardship theme into the product's own economics.

4.5 Optimyse (Scrip) — Treasury Management

Optimyse, currently named Scrip, is an algorithmically managed trading system responsible for money at work. It actively manages assets under management (AUM) on its own book and bears genuine investment risk directly — it is, in substance, a fund manager, and is expected to be licensed and capitalised accordingly (Section 6). It is not a passive router directing client funds to third-party vehicles.

5. Market Positioning

Opay and PalmPay are Nigerian-market super-apps that achieved dominant retail adoption by bundling payments, savings, and micro-lending into a single daily-use wallet. ProdeoPay follows the same proven bundling strategy, with Talent as its

structural point of difference: a wallet balance genuinely insulated from national-currency inflation and devaluation, rather than merely a savings feature denominated in the same currency being protected against.

This is the same product-expansion sequence followed by Alipay, WeChat Pay, and M-Pesa — starting as a narrow payment rail and expanding, once daily transaction relationships with millions of users are established, into savings and then wealth management. Payments-first, savings and investment following, is a proven path, not a novel bet.

6. Regulatory Positioning

Purse's core credit-union functions (inclusion, anti-usury lending, social-collateral underwriting) do not themselves carry investment risk and are expected to sit within a cooperative-society or credit-union regulatory track, such as the Bank of Sierra Leone's regulatory sandbox.

Optimyse, because it actively manages AUM rather than only routing to external vehicles, falls within whichever collective-investment-scheme or asset-management licensing regime governs the jurisdictions in which it operates, and requires capital adequacy provisions consistent with that status. Three obligations follow directly from that status:

Matching — client funds are earmarked to specific, traceable positions rather than commingled into an undifferentiated pool.

Underwriting — Optimyse holds its own capital reserve, sized against the probability and severity of losses on the positions it manages.

Liquidity terms — redemption terms are disclosed honestly and matched to how quickly underlying positions can actually convert to cash, including stated notice periods or gates for stressed conditions.

Talent, if it is to retain genuine property-money status, requires its own audited, continuously reconciled link between wallet balances and physical gold holdings, structurally analogous to the discipline required of ARU in the separate Strategy and Policy Document, but implemented as Prodeo Capital's own commercial obligation, not a shared institutional one.

7. Relationship to Institutional Monetary Policy Work

Prodeo Capital's commercial success does not depend on ARU, PAPSS, or the Convergence Compact being adopted by any institution. This roadmap is written to succeed on its own commercial merits, as Opay and PalmPay have.

If the institutional architecture set out separately in the Strategy and Policy Document does advance, it presents a genuine opportunity rather than a dependency: Talent could settle across borders through PAPSS rather than needing bespoke cross-border rails, and ProdeoPay's live activity in the Mano River corridor could serve, if disclosed transparently as a private pilot rather than presented as institutional evidence, as one useful data point among others for that separate policy conversation. The two should continue to be evaluated, resourced, and presented independently.

8. Open Items

#	Item
1	Confirm Optimyse's target licensing jurisdiction(s) and engage counsel on asset-management registration requirements.
2	Design and audit the specific custody and reconciliation mechanism linking Talent wallet balances to physical gold holdings.
3	Finalise ProdeoPay's product roadmap relative to Opay/PalmPay feature parity ahead of launch.
4	Determine Purse's regulatory pathway (BSL sandbox vs. cooperative-society registration) independent of Optimyse's separate licensing track.
5	Decide the disclosure language for any reference to Mano River pilot activity within institutional-facing policy materials, to preserve the separation set out in Section 7.
